

Transformer--Class A Power Amplifier, Pull and Push Amplifier, Fever Amplifier, Stage Amplifier, and High Fidelity Power Special Toroidal

The sound equipment of power transformer influences the key module of the sound amplifier's performance. The winding of toroidal transformer is not divided two to wind, but lap wounded inside and outside. Its core use the cold pricking grain tropism silicon steel sheet, which is made with automatic rolling iron machine. Its winding craft and the magnetic of iron core can make it high flux density, small leakage, small internal resistance, high efficiency. Because of the small leakage, so it can reduce the electric jamming, and improve the sound amplifier's noise. To the high fidelity power amplifier, the small internal resistance and quick responding character of toroidal transformer are important, so we use the toroidal transformer as the best choice for high fidelity sound amplifier, no wonder some famous amplifier of inside of outside country are claimed: "Use the toroidal transformer".

This is our **Transformer--Class A Power Amplifier, Pull and Push Amplifier, Fever Amplifier, Stage Amplifier, and High Fidelity Power Special Toroidal**, if you have some question about it, you can contact with us at any time. Meanwhile we can design and product according to your requirement.

Attention: Because of the error of input as well as vision, all Dibao transformer pictures' real situation based on real object or sample.
